Question 23 (6 marks)

The diagram represents a nephron which is the functional unit of the kidney.

Nephrons make urine by:

- filtering small molecules and ions from the blood;
- reabsorbing the needed amounts of useful materials.

Surplus or waste molecules and ions flow out as urine.

- (a) Identify the area where filtration occurs, by marking it with an X on the diagram. 1
- (b) Identify the area where reabsorption occurs, by shading it on the diagram. 1
- (c) Discuss the importance of hormone replacement therapy for people who cannot secrete aldosterone. 4

Hormone replacement therapy helps people secrete aldosterone which helps with the concentration of ~~sed~~ salt in the kidney nephron.
