

(a) i - The Corti organ helps us to hear and if this organ is damaged it leaves that person either completely deaf or partial deaf, it depends on the damage. It controls the main part of the ear that allows us to hear.

ii - Wavelength is the length in which the wave is measured and how far it reaches, the distance. Frequency is how many times the wavelength reaches a certain height. The pitch of a sound is how low or how high that ~~solo~~ sound is. These can all be measured.

iii - Not Attempted.

(b) i - Not attempted
ii - Not attempted.

(c) i

ii - The lower the thickness of the lens
the higher the focal length gets.

iii - The human eye can focus objects from
different distances because of the lens and
how far the lens can focus different objects
at different distances.

(d) The retina is positioned at the back of
the eye and it is mainly responsible ~~for~~ for
letting ~~a~~ light into the eye and how much
light the eye receives. Being positioned at
the back of the eye helps the structure of
the eye and the other parts and their
functions. The electrochemical signals are then
passed on around the rest of the eye.

2002 HIGHER SCHOOL CERTIFICATE EXAMINATION
Biology

This page is to be detached, completed and attached to the inside front cover of your writing booklet for the option question you have attempted.
