Question 21 (10 marks)

The diagram shows information about the demand and supply of Australian dollars (\$) in terms of United States dollars (\$US). Both countries have flexible exchange rates.

- (a) State the economic term given to the movement of the exchange rate of the \$A from \$US0.50 to \$US0.60. 1

.....Appreciation.....

- (b) Outline TWO causes of an increase in demand for \$A. 2

If the demand for Australian exports increases then foreign customers will have to exchange their currency for \$AUD, therefore increasing the demand for Australian dollars. If speculators believe that the Australian dollar is about to appreciate they will buy more \$A hence increasing the demand for \$A

Question 21 continues on page 10

Question 21 (continued)

- (c) Briefly explain how the Reserve Bank could intervene in the foreign exchange market to influence the exchange rate of the \$A. 3

The Reserve Bank could buy or sell \$A, which would affect the supply of Australian dollars. For example if the Reserve Bank wants to increase the value of \$A they will buy dollars, hence reducing supply, when supply decreases the price increases, hence the \$A will appreciate. If the Reserve bank wants to decrease the value of \$A they would ~~buy~~^{sell} \$A, hence increasing supply, when supply increases the price decreases, hence the \$A would depreciate.

- (d) Discuss TWO economic benefits to Australia of an appreciation of the \$A. 4

When the \$A appreciates the value of the foreign debt in terms of \$A decreases, hence leading to a lower current account deficit, affecting the net incomes section of the current account thus decreasing the CAD.

When the \$A appreciates imports become cheaper, which means ~~an~~ Australians would have to pay less for imports. This would have an affect on the net goods section of the current account thus reducing the CAD.
