

Start here.

An ecosystem is the relationship between organisms and their surrounding environment. The Great Barrier Reef and ~~Cuc~~ Cuc Phuong National Park are both ecosystems at risk. It is through human-induced change and natural events our ecosystems are destroyed.

Great Barrier Reef is over 2000km long and it is situated on Australia's North East coast. Due to coral bleaching and endangered species the Great Barrier Reef is slowly fading away and it is believed that ~~the~~ by 2050 it ~~will~~ will be destroyed. We as humans need to take blame for what were causing to occur while reducing our movement their to try keep it longer. Its through fishing, oil spills, boats, pollution ~~and~~ tourism, global warming etc that we have damaged this ecosystem.

Similarly, with Cuc Phuong National Park the tourism side of things has also contributed to the damage of its ecosystems. The rubbish left around it appalling not to

mention dangerous towards different species.

Natural events also destroy ecosystems, for example the great barrier reefs star fish are ~~so~~ excessively reproducing meaning they need more prey. They are feeding off the coral which both bleaches and breaks the coral, killing it off.

In conclusion, its events like these human and natural occurrences that kill off or destroy ecosystems.
