

Q22

of ~~Doctors~~

Advantage - Doctors can get information about that person when ever they need it

disadvantage - how safe is the information, who will have access to that information, can the system be misused by people looking up information when there not suppose to.

by the storage part of the system will have to have a backup system in case of a system breakdown or the information is suddenly loss by human or unknown error.

The retrieval of data is a major issue because it raises the issue of who should have access to the data so a security system eg password for only the people who need access to the information

will have it no not everybody can see the patients information.

The display of images in the information system can limit the systems input as it needs more memory to hold or store them

~~Q22~~

S

because the receptionist dont need to see the same information that the doctors do.

patients only want the doctor to know there health problems and if the receptionist see's it they to will know about the patients medical history and there is no confidentiality.
