Question 22 (6 marks)

Two types of generator are shown in the diagram.

- (a) What is the function of the brush in a generator? 1

To keep contact with the rings to provide a complete circuit.

- (b) Which of these generators is a DC generator? Justify your choice. 3

Generator Q. A DC generator requires a split-ring commutator. Since the current in a generator is reversed every half-turn, the split rings ensure a reversal of the coils position, reversing the current again to provide an always-positive current.

- (c) Outline why AC generators are used in large-scale electrical power production. 2

Since AC induction generators are much more simple and efficient than DC generators. Also, AC voltage can be conveniently stepped-up through AC-rated transformers, allowing for smaller power lost over long transmission through wires.
