C) Technology may impact peoples lives regarding work and leisure in the future in many ways.

One negative aspect of technology regarding computers and people who work with them daily or use it for their leisure time is Carpal Tunnel and Obesity.

People may encounter these two diseases in their future as they're quite common diseases. Carpal Tunnel is something that people could easily get from the computer because when you use it, you do the same repetitive motion over and over again which is what causes the disease. ~~There are also quite common~~ ^{From the clicking of} the mouse ~~to the ongoing typing.~~ to the ongoing typing. It never ends

this motion. When it comes to the television Obesity has become a very popular and common problem. The fact that people sit in the same spot for hours and hours on end and endure

no physical activity puts their bodies in danger as there is no rapid blood flow occurring which slows the metabolism and causes easier weight gain.

People also see commercial ~~ads~~ ads advertising junk food which persuades viewers to eat while they watch tv. This then leads to

them becoming 'couch potatoes' Obesity falls in the same categories as computers as well as they

both involve sitting down. Eye issues may also occur in the future as well as becoming anti social

as people rely heavily on texts and i chat as their form of communication which lacks peoples confidence and makes them anti social to the outside world.

All these factors may impact peoples lives immensely as it might not allow them to work in the future and have a steady income flow. They also might not be able to enjoy physical activities anymore due to obesity which then results to diabetes. This is why people shouldn't abuse there technology rights and use it in moderation so they can avoid these health risks.
