

21. @ i)

~~Read number of trains (0)~~

D) while the number of trains is 0 the program will ~~not~~ work it will ~~stop~~ ~~start to end~~.

D) while the number of trains = 1 it will go straight ~~Recommended solution place a boundary on number~~ to the end of the sub program. This would not work ~~at train so it will not accept 0 for 1~~ because ~~the~~ first train would ~~always~~ be missing

Recommended solution to remove 1 from the selection of number of trains

2) While the number of trains is ~~two~~ the program will work only until the trains = 2 then it will skip 2 and go on to 3.

Recommended solution make the selection of number of trains 0 and make it permanent and unchangeable.

ii) This algorithm does not work because it misses a train every time except when ^{zero} is entered there fore it ~~loses~~ ^{leaves} a train unmarked and could cause a collision.

I came to this conclusion by running a test ^{data} ~~data~~ of 0, 1 and 2 through a desk check.

when the data was entered and number of trains equald ~~zero~~ the program ran through the while stat ment collecting the trains details. While when 1 and 2 were entered it skipped the statment on trains 1 and 2 there for leaving them blank also this program only runs once.

iii) I would remove ^{the more than simple} ~~number of trains and~~
on the while statement
~~replace it with~~ this will remove the
missing train and display it.

Before the end I would place a repeat
statement so that it will repeat until the
the ~~number~~ ^{number} of trains = the number of tracks

b) i) one ethical issue involved with this
would be copyright laws and plagiarism.
This means that the person did not notify the
owner of the code and passed it as his own
this is not allowed through the copyright Act and
is a punishable offence that can ~~incure a fine~~ ^{end up costing}
the person that copied it by a fine or even ~~just~~
goals.

ii) one way management could avoid these
problems is by doing a back ground check on the
code and see what copyright restrictions are

placed on the code this may range from no
you can not copy it to just having to place the
owners name - and web site on the credits list.

They can also avoid this by asking for
proof that the programmer actually wrote the
code. This would stop the copying of illegal
software code into another software program.

Also the manager can run a back ground
check on the programmer to see if any
of the previous programs had any of
these faults.
