

Question 2(a)

	DAYS	WK1	WK2	WK3	WK4	WK5	WK6	WK7	W8	W9	W10	WK11	WK12
Defining & Understanding the problem	14	Shaded	Shaded										
Planning & designing	28			Shaded	Shaded	Shaded	Shaded						
Implementation	14							Shaded	Shaded				
Testing & Evaluating	14									Shaded	Shaded		
Maintenance	14												Shaded

Since the manager wanted to use the structured approach there are 6 stages which is involved in using the structured approach, Defining & understanding the problem, planning and designing the problem, Implementation of the problem, testing and evaluating the problem and the maintenance of the problem, as it was set out by the manager that the project will have 12 weeks set aside, each stage taking the same amount of time, except the planning & designing will take 2 weeks except for planning & designing which should take twice as long as all the other stages.

By having the original data dictionaries and test data of the original system it will make

It is easier to modify the solution as all the technical documentation is already done and makes it easier to modify as data dictionaries contain all the data which is contained within that system such as data type, the size, reason for inclusion and so on. Test data is useful as test data contains all the data which has been tested so if any modification is needed it can be spotted easily or they can use the information used to modify the existing system further.

c)

Amount	Desk check	Actual Result
22		
33		
11		
222		

ii)

1 BEGIN

2 OPEN Transaction

3 total = 0

4 gst_total = 0

5 aver_trans = 0

6 READ first record

7 WHILE record NOT sentinel

8 total = total + Transaction.amount

9 gst_total = gst_total + Transaction.gst

10 aver_trans = (gst_total + Transaction.gst) / total

11 READ next record

12 ENDWHILE

13 OUTPUT total, gst_total, aver_trans

14 END

d) This particular CASE tool shows how it

helps the program as ~~if~~ each time a version of the

product is created, the information is stored in

a sequential file, and keeps a track of the versions

and lines of code in each modification

to their main software product. As it

stores all the files in a sequential file, people

which come back to see what versions were available
can easily be able to see the versions used.

ii) .BEGIN

RESULTS = 0

VERSION = 0

READ first version
