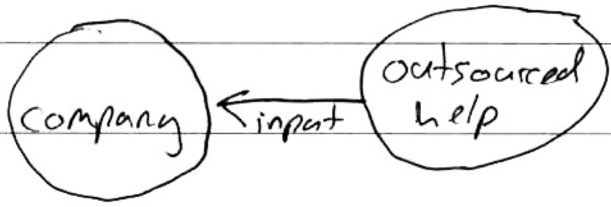
Q 22

a) I) Outsourcing is when a company leaves its own internal capabilities for solving a problem, and allows a company or trade to solve the problem that the original company could not.



II) There are moral implications. The outsourced company would understand entirely how this new internal network functioned, making it vulnerable. The bank would need to trust the company they outsourced to. Also information from the company's financial database would be readily available to the company constructing the software (as they would need precise specifications of the original system). Also, depending on what type of implementation was used, maintainance or regular check ups may be required, further increasing the confidential material within the system becoming more at risk of being viewed or obtained.

b) I) = an input in the system
= a descision made by the system, or an output dysplayed to the user.

~~II)~~
